Lab: Using GUI builder

This lab is based on the tutorial we went through in class (also attached to the lab). In class, we created a GUI program that looks like the figure below. The user can type in a first number, second number and click on the Add button and the result will appear in the Result field. The user can click on the Clear button which clears all fields and the Exit button exits and closes the program

For this lab, you are to add the following buttons:
- Subtract button(subtracts the first number from the second number and outputs the result in the Result field)
- Multiply button (multiples the first number from the second number and outputs the result in the Result field)
- Division button(divides the first number from the second number and outputs the result in the Result field

Guidelines for a good program:
The program works, following the dialog and rules above.
The code is clear and understandable:
Properly indented
Representative variable names
Blank lines separate logical sections of code
Appropriate comments included (java doc comments for each method)
Preamble documentation is included
Thoroughly test program
Review program assignment rubric
